# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

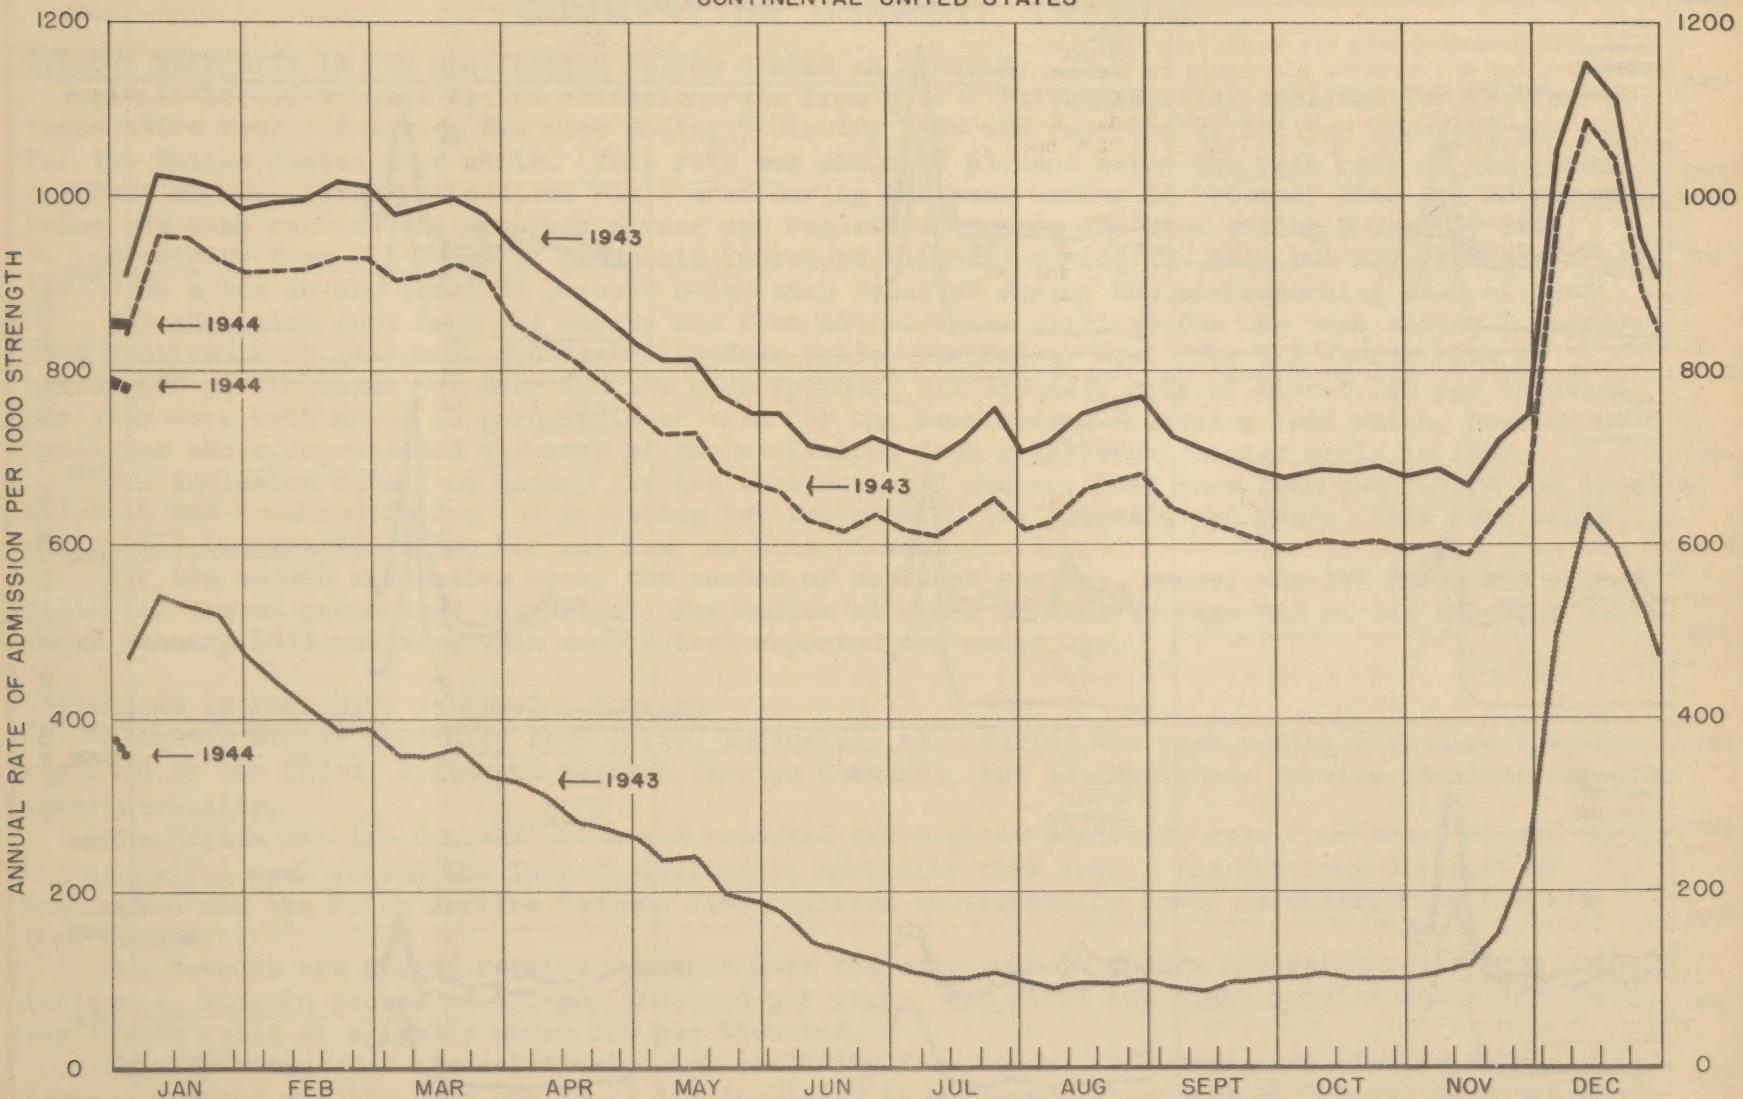

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEK ENDING 7 JANUARY 1944

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated on page 3, the admission rate from colds, influenza, etc. declined for the fourth consecutive week and during the week ending 7 January 1944 was reported at 351 per thousand per year for the United States as a whole. This rate was about 45 percent below the peak rate of the recent outbreak of respiratory infections registered during the week ending 11 December 1943 and 35 percent below the peak rate of the outbreak a year ago registered during the week ending 8 January 1943.

Morbidity from all forms of pneumonia increased slightly during the week but nevertheless continued on a low level, about 25 percent below that reported during the corresponding week of 1943.

The admission rate from all causes and from all diseases combined for the week ending 7 January 1944 declined much less than did morbidity from colds, influenza, etc. The all causes rate at nearly 850 per thousand per year and the corresponding all diseases rate of almost 780 per thousand per year were both about 18 percent lower than for the week ending 8 January 1943 which, however as mentioned above, represented the peak of the admissions from respiratory causes early in 1943.

The admission rate from injury for the week ending 7 January 1944 rose from the record low level at which it had remained during the preceding two weeks to 70 per thousand per year. This rate would ordinarily be considered low for the Army in time of war.

For the second successive week, the number of cases of measles, mumps, scarlet fever and meningitis all showed pronounced increases. The number of cases of measles reported during the week ending 7 January 1944 was more than double that reported two weeks ago.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

Slightly higher morbidity from colds, influenza, etc. during the week ending 7 January 1944 was reported by the Third, Sixth and Seventh Service Commands, but all the other Service Commands reported lower morbidity.

The Eighth Service Command which had reported the highest admission rate from these causes during the preceding week showed the largest decline in morbidity this week. The Military District of Washington and the Fifth Service Command also reported substantially lower morbidity from respiratory causes.

The Seventh and Second Service Commands were the only ones to report admission rates from colds influenza, etc. in excess of 400 per thousand per year. The First and Ninth Service Commands showed the lowest rates of slightly under 300 per thousand.

Chiefly because of its relatively high morbidity from colds, influenza, etc. the Seventh Service Command was the only one to report morbidity from disease in excess of 900 per thousand per year. As during the preceding week the First Service Command continued to report the lowest morbidity from disease, only 629 per thousand.

# WEEKLY HEALTH REPORT

WEEK ENDING 7 JANUARY 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

The Fifth and Sixth Service Commands reported markedly higher rates of venereal infections (excluding EPTI cases), while the First Service Command and Military District of Washington continued to show low morbidity.

The number of cases of measles increased most in the Eighth Service Command, but about 45 percent of the total number of cases in the country were reported from the Fourth Service Command. The number of cases of mumps increased most in the Ninth Service Command, which reported about as many cases as the Fourth Service Command, each accounting for over 25 percent of the total in the country. The Ninth Service Command also reported about 25 percent of the total number of scarlet fever cases. The largest increase in meningitis cases was in the Fourth Service Command which accounted for almost 40 percent of the total in the Continental United States.

### NON-EFFECTIVE RATE

The mean number of non-effectives for the country as a whole (which at the peak of the influenza out-break rose to 44 per thousand) was reported at 38 per thousand during the week ending 7 January 1944. This is not only lower than for the week ending 9 January 1943 but also below the level prevailing in November 1943.

The variations in the non-effective rates by Service Command do not reflect so much the differences in morbidity between the Service Commands as the varying distribution of general hospitals. When comparison is made between the non-effective rates by Service Command excluding general hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in the general hospitals are included.

### CURRENT HOSPITALIZATION CONDITIONS

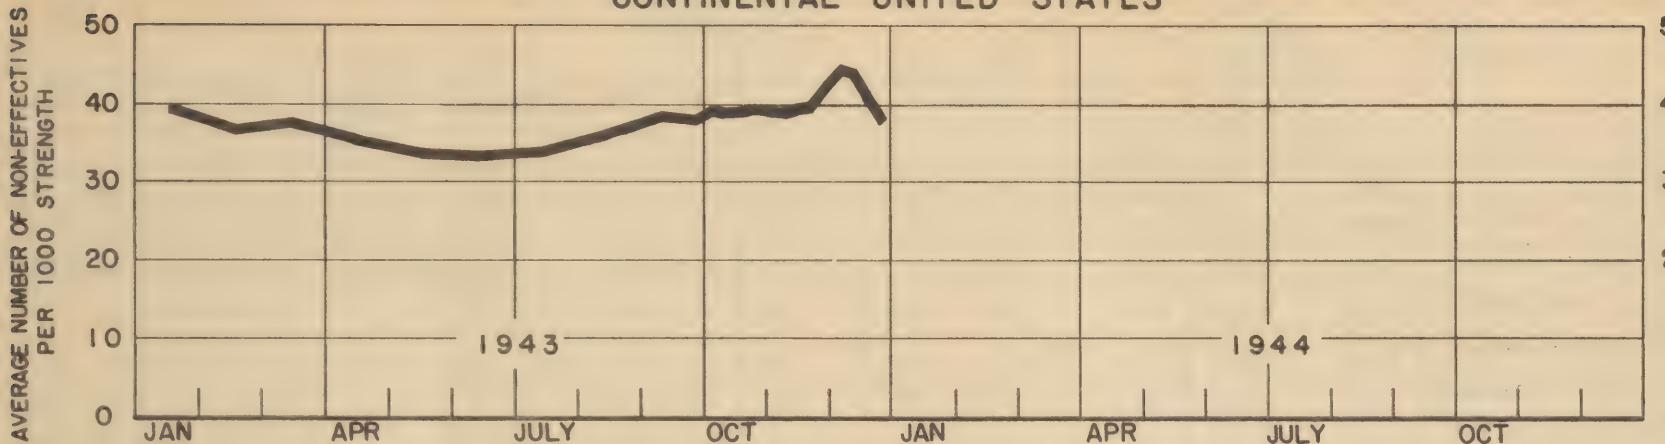

The total bed capacity reported as of 7 January 1944 was nearly 364,000. This apparent increase in capacity of about 7,000 beds as compared with 31 December 1943 represents largely a change in the basis of reporting bed capacity and not an actual increase.

The number of beds occupied as of 7 January 1944 was about 176,000 or an increase of almost 6,000 over the previous week; at the same time the number of "available vacant" beds remained level at about 116,000. On 7 January there were 22 stations with a bed capacity of about 12,000 which had no "available vacant" beds; included among them were 3 general hospitals with a bed capacity of about 5,000 beds.

On January 1944 there were 2,166 cases of malaria remaining under treatment all but 35 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 15,309, while the number of tuberculosis cases remaining totaled 1,006.

# SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 DECEMBER 1943

## PRISONERS OF WAR

During the five week period ending 31 December 1943, morbidity from all causes among prisoners of war was at the relatively low level of about 710 admissions per year per thousand strength or only about 70 percent of that for U.S. troops in the continental United States during the same period. Morbidity from all diseases combined during this period was only 625 per year per thousand strength or only about 65 percent of that for U.S. troops in this country. As compared with November, the admission rates for all causes and all diseases combined were about 25 percent higher, almost entirely as a result of increased morbidity from colds, influenza, etc. The injury admission rate for December was somewhat lower than for the previous month and at about the same level as that for U.S. troops in the continental United States. The December admission rates for all diseases combined were about the same for German prisoners as for Italians, but on the other hand the injury rate for German prisoners was substantially higher than that for Italians, just as in previous months.

Morbidity from colds, influenza, etc. among prisoners of war increased sharply from 70 per thousand in November to 238 per thousand in December. Nonetheless, the rate for prisoners of war for December was well below the corresponding rate for U.S. troops in the continental United States which was about 500 per thousand. The markedly lower rates of admission from respiratory causes among prisoners of war account in large part for the much lower morbidity from all diseases combined among prisoners of war as compared with U.S. troops in the continental United States. An important reason for the lower morbidity from respiratory causes among prisoners is that the camps are predominately located in the Southern states which did not experience the extremely high morbidity from colds and influenza that the remainder of the country did during December. Thus the rate of admission for respiratory causes among U.S. troops in the Fourth and Eighth Service Commands, in which about 75 percent of the German and 40 percent of the Italian prisoners are located, was only about 450 per thousand in December as compared with 600 per thousand for the other Service Commands. In this connection it is noteworthy that the Italian prisoners of war who are less predominately located in the Southern states (a substantial number of them being in the Middle West) experienced a higher morbidity from respiratory causes than did the Germans; namely, an admission rate of 345 per thousand strength as compared with a rate of 196 per thousand strength for the Germans.

In December there continued to be a significant number of cases of diphtheria, all among German prisoners, but the number of cases of jaundice was only half that in November. The annual admission rate from malaria among prisoners of war (representing cases acquired outside of the United States) decreased from 30 per thousand strength in November to 17 per thousand strength in December. Morbidity from malaria continued to be at a somewhat higher rate for Italian prisoners than for Germans, the rates of admission being 20 and 17 per thousand respectively. The admission rate from diarrhea and dysentery decreased to 6 per thousand strength, or about the same level as that for U.S. troops in the continental United States. All the other causes of admission considered in the tables showed relatively small numbers of cases.

In December there was a considerable range in the admission rates as between different camps, to a large extent due to the outbreaks of respiratory diseases in some camps. As in previous months, certain camps continued to have high injury admission rates; included among these are Clinton, Miss. (German), Camp Shelby, Miss. (German), Camp Gruber, Okla. (German), McLean, Texas (German), Ruston, La. (German) and Camp Perry, Ohio (Italian) all of which had rates of about 300 per thousand or more.
